

# **Conducting Leading-Edge Software R&D in a Globalized, Commoditized World**

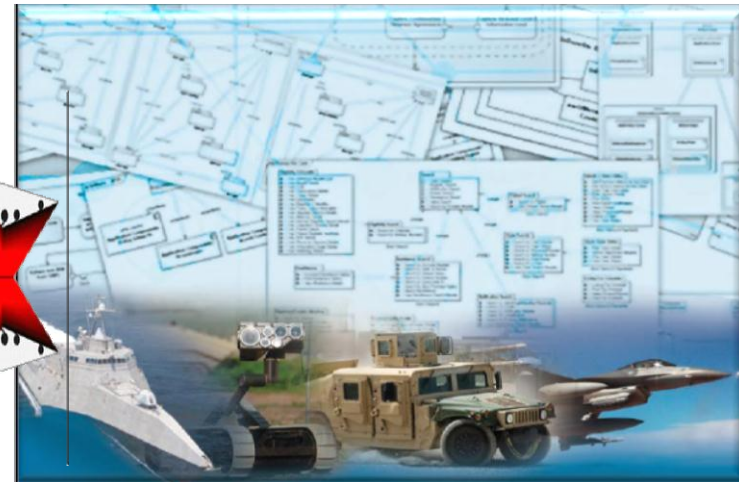

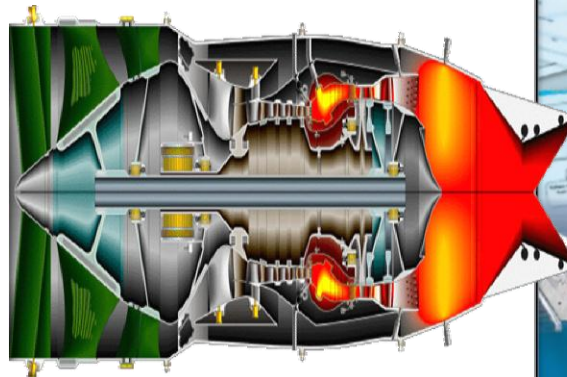

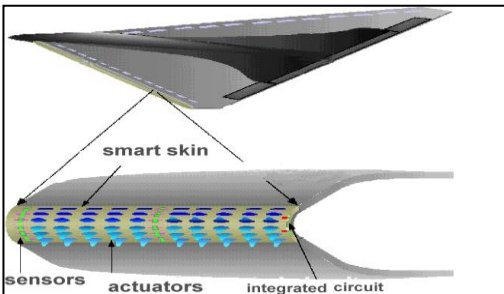

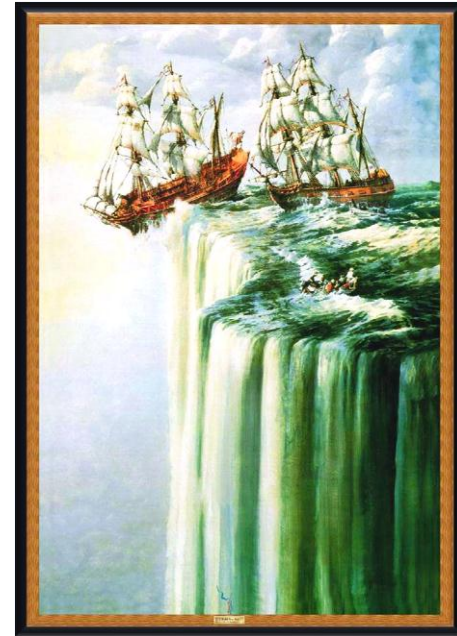

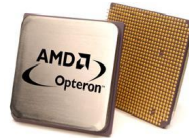

Dr. Douglas C. Schmidt

Deputy Director, Research, and Chief  
Technology Officer

Software Engineering Institute, CMU

# What this Talk is About

- The impact of **globalization** & **commoditization** of information technology (IT) on **software R&D**
- **Globalization**
  - “I speak Spanish to my God, Italian to women, French to men, German to my horse, & **Japanese to my boss**”
    - Paraphrasing King Charles the 5<sup>th</sup> of Spain
- **Commoditization of IT**
  - “Everything gets cheaper forever”
    - John Chambers, CEO Cisco Systems
- **Software R&D**
  - Innovating software for competitive advantage

Conducting Leading-Edge Software R&D in a  
Globalized, Commoditized World

# What I Do at the SEI

Provide technical management across SEI lines of business to ensure that SEI program R&D plans are aligned with overall SEI R&D strategy plans

## Chief Technology Officer role

- Lead the formulation of the SEI's technology strategy
- Amplify external relationships with academia & industry
- Align the expertise of the SEI technical staff to identify & respond to the needs of sponsors, customers, & partners
- Help the SEI shape future innovations in complex software-reliant systems

## Deputy Director, Research role

- (Meta) Manage the line funded programs, including the Internal R&D program
- Manage the technical interface to the DoD & other US government agencies

SEI's research program is essential to ensure a long/healthy future as an R&D FFRDC

Conducting Leading-Edge Software R&D in a  
Globalized, Commoditized World

# Consequences of IT Commoditization

# The Road Ahead

CPU & network performance has increased by orders of magnitude in past decades

10 Megahertz to  
~3 Gigahertz

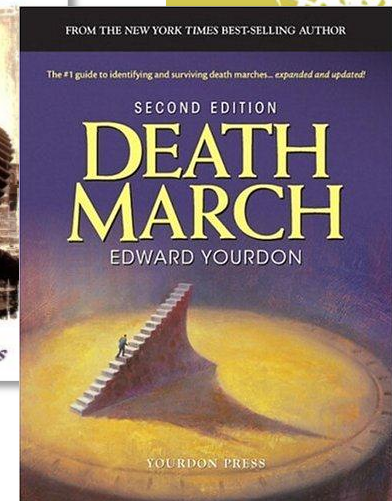

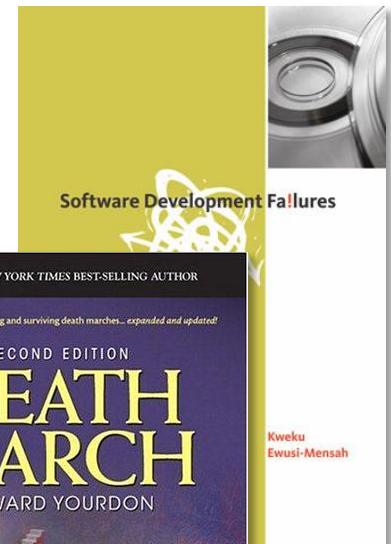

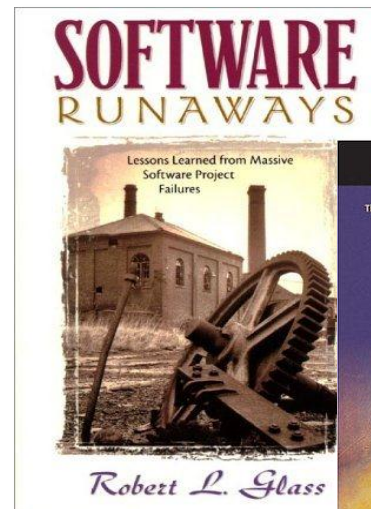

1,200 bits/sec to  
10+ Gigabits/sec

Extrapolating these trends another decade or so yields

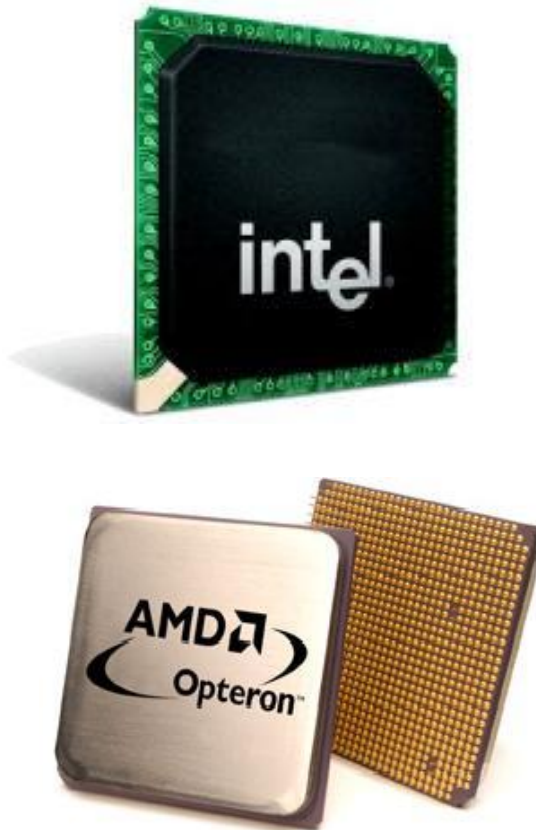

- ~4-5 Gigahertz CPUs with 10s-100s of cores
- ~100 Gigabits/sec LANs
- ~100 Megabits/sec wireless
- ~10 Terabits/sec Internet backbone

Unfortunately, software quality & productivity hasn't improved as rapidly or predictably as hardware – especially for mission-critical distributed real-time & embedded systems

# Why Hardware Improves So Consistently

Advances in hardware & networks stem largely from R&D on *standardized & reusable* APIs & protocols

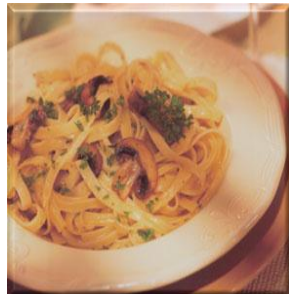

x86 chipsets

TCP/IP

# Why Software Fails to Improve as Consistently

*Proprietary &  
Stovepiped  
Application &  
Infrastructure  
Software*

*Standard/COTS  
Hardware &  
Networks*

Commodity software quality has historically lagged behind commodity hardware, especially for mission-critical distributed real-time & embedded systems

# What's So Hard About Software?

## Technical Complexities

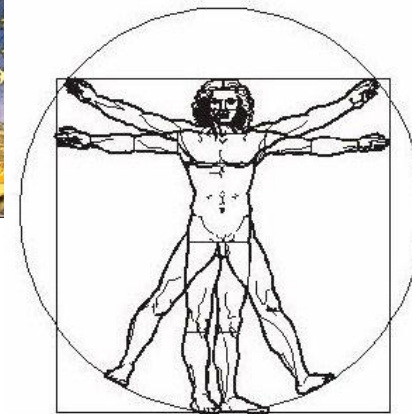

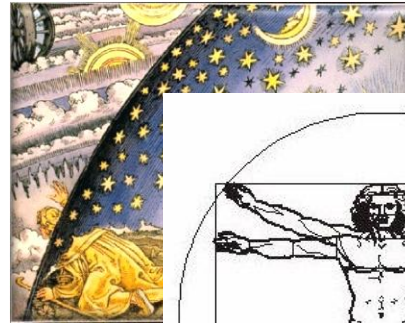

## Accidental Complexities

- Low-level APIs & debugging tools
- Interoperability & portability

## Inherent Complexities

- Quality of service (QoS)
- Scheduling & synchronization
- Intermittent connectivity
- Information assurance
- ...

## Human Nature

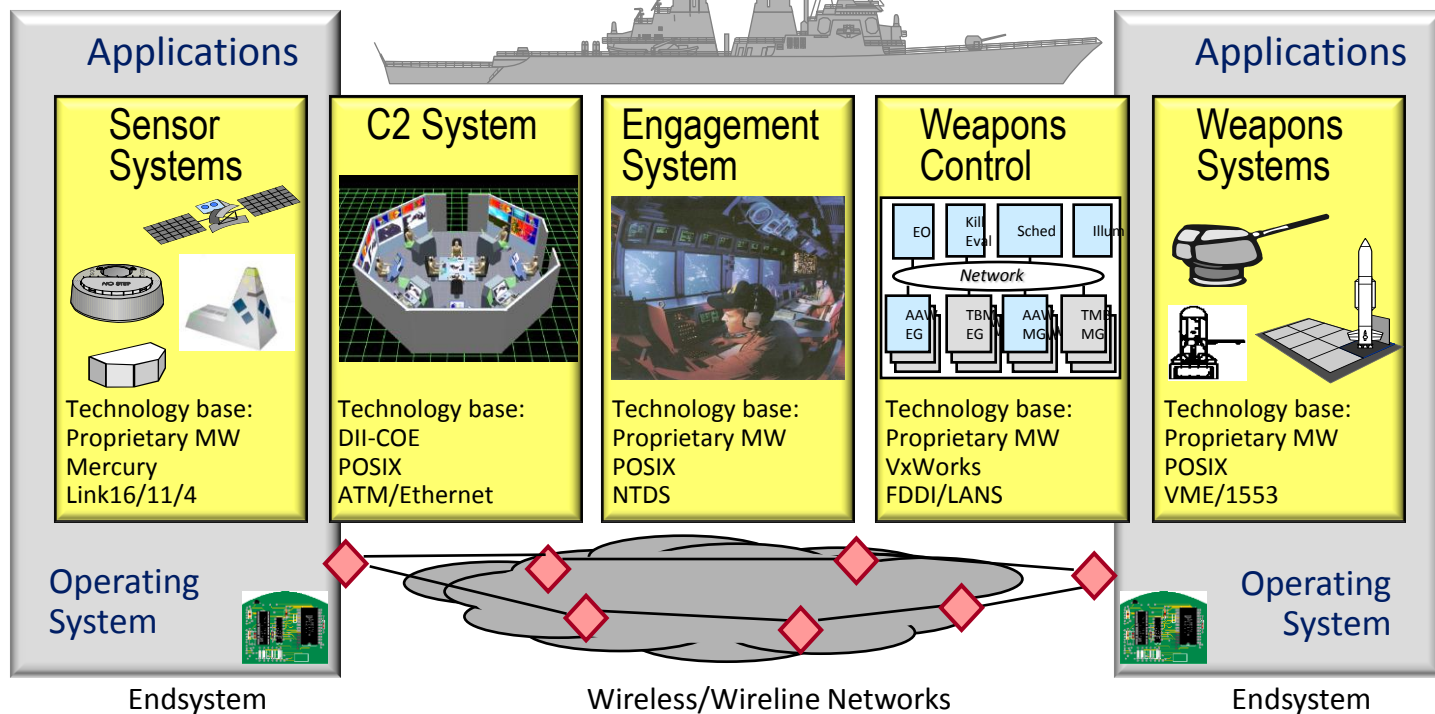

- Organizational & managerial impediments
- Economic impediments
- Policy impediments
- Political impediments
- Psychological impediments
- ...

# Evolution of DoD Software Development

Legacy DoD systems have historically been:

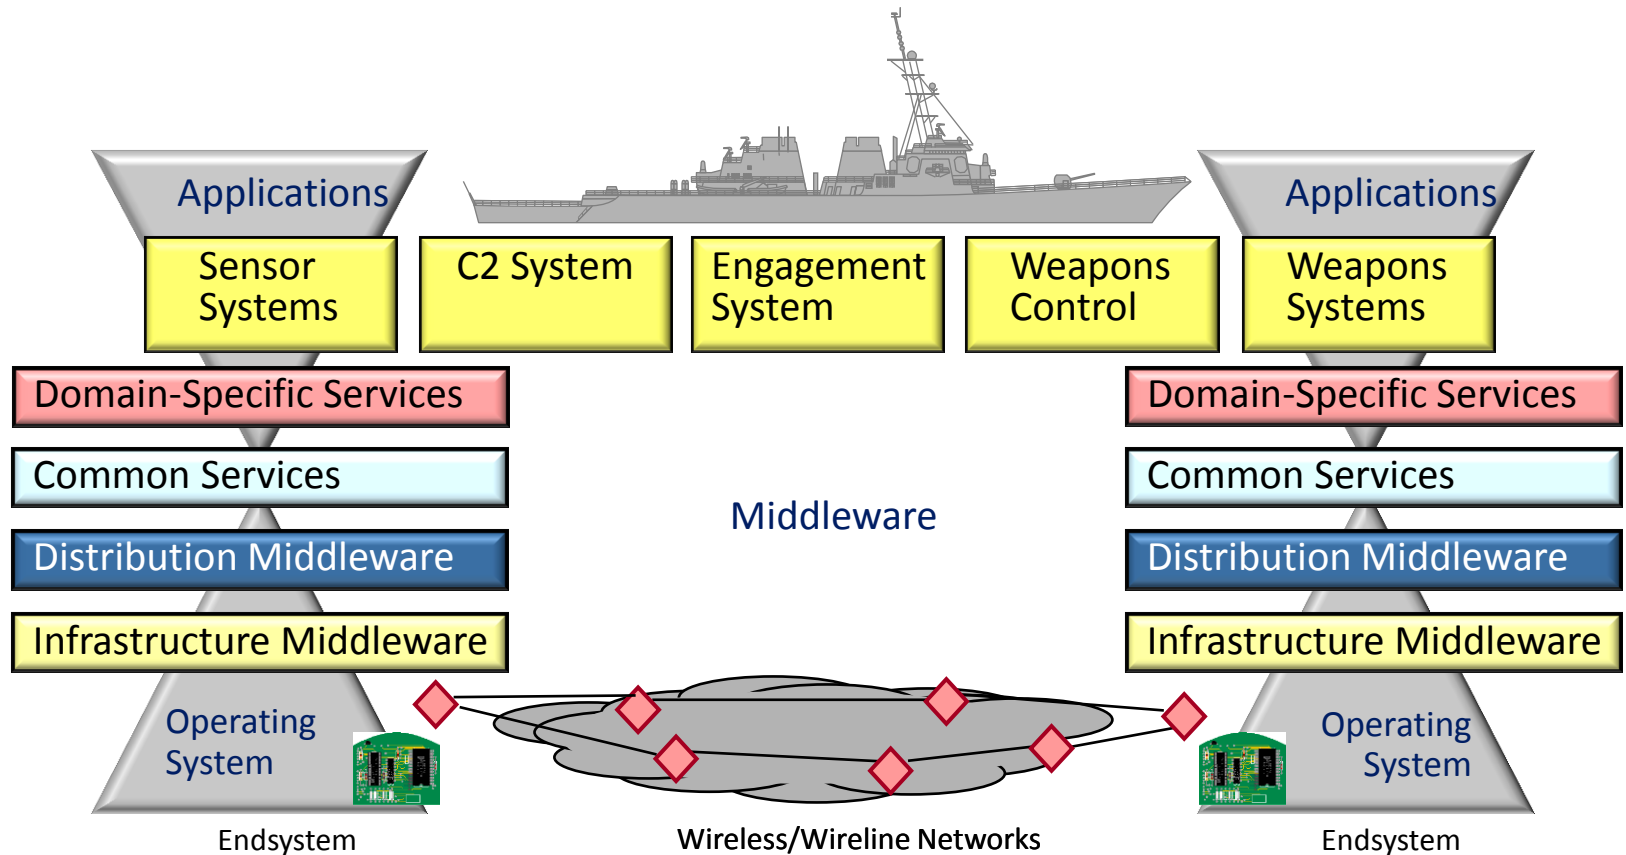

- Stovepiped
- Proprietary
- Brittle & non-adaptive
- Expensive
- Vulnerable

*Consequence: Small HW/SW changes have big impact on system QoS & maintenance*

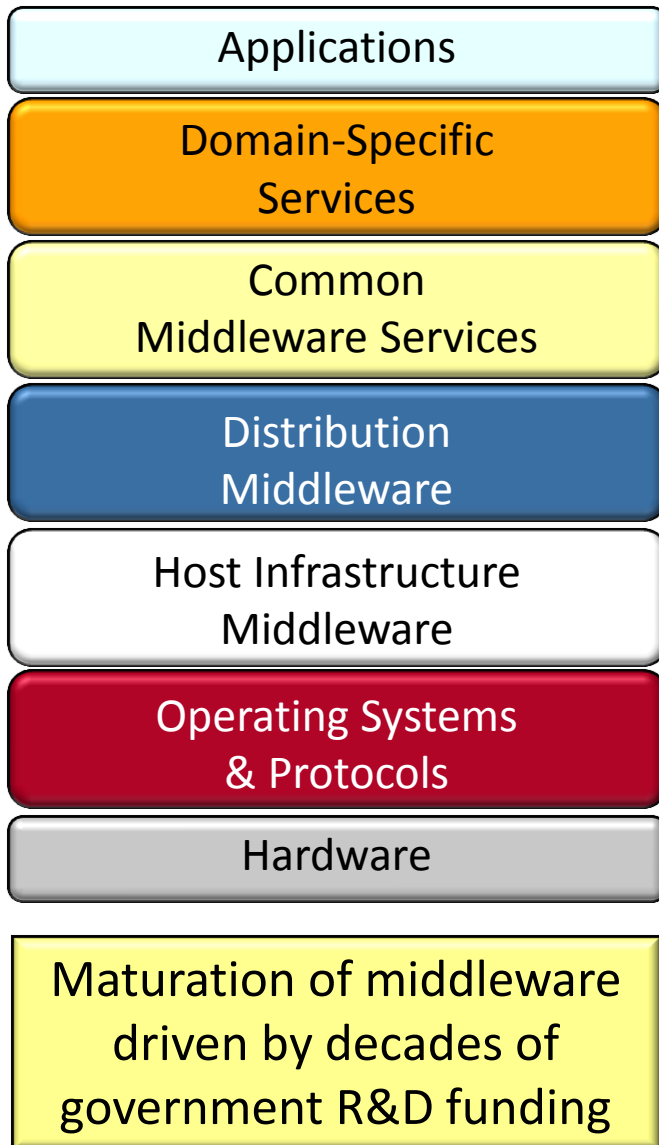

# Evolution of DoD Software Development

- *Middleware* has effectively factored out many reusable services from traditional application responsibility
- Essential for product-line architectures, common operating environments, open architectures, etc.

# Example: The Evolution of Middleware

Historically, mission-critical apps were built directly atop hardware & OS

- Tedious, error-prone, & costly over lifecycles

There are layers of middleware, just like there are layers of networking protocols

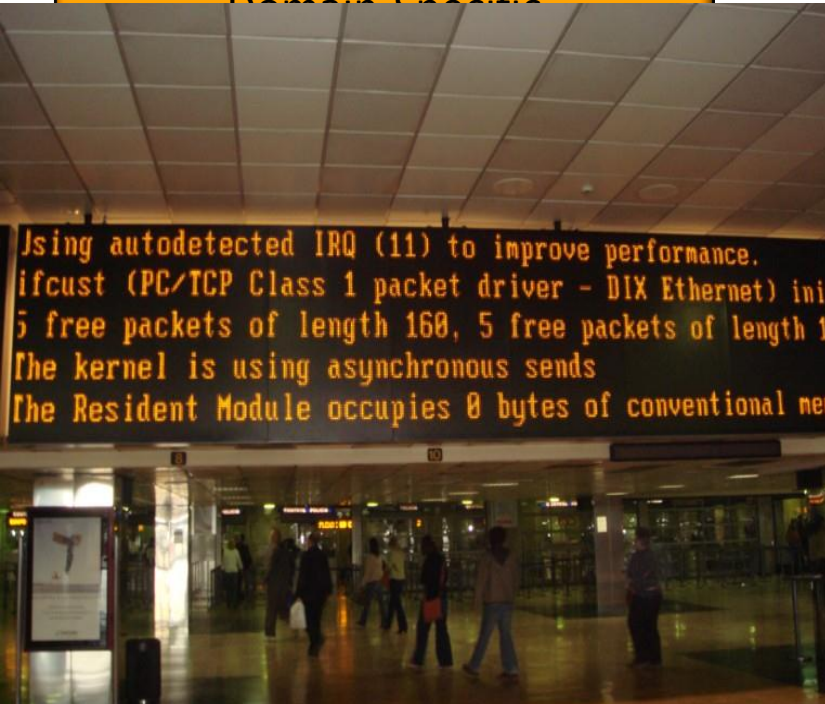

Standards-based COTS middleware helps support key mission goals:

- Control end-to-end resources & QoS
- Leverage hardware & software technology advances
- Evolve to new environments & requirements
- Provide a wide array of reusable, off-the-shelf developer-oriented services

# Consequences of Software Commoditization

Applications

Domain Specific

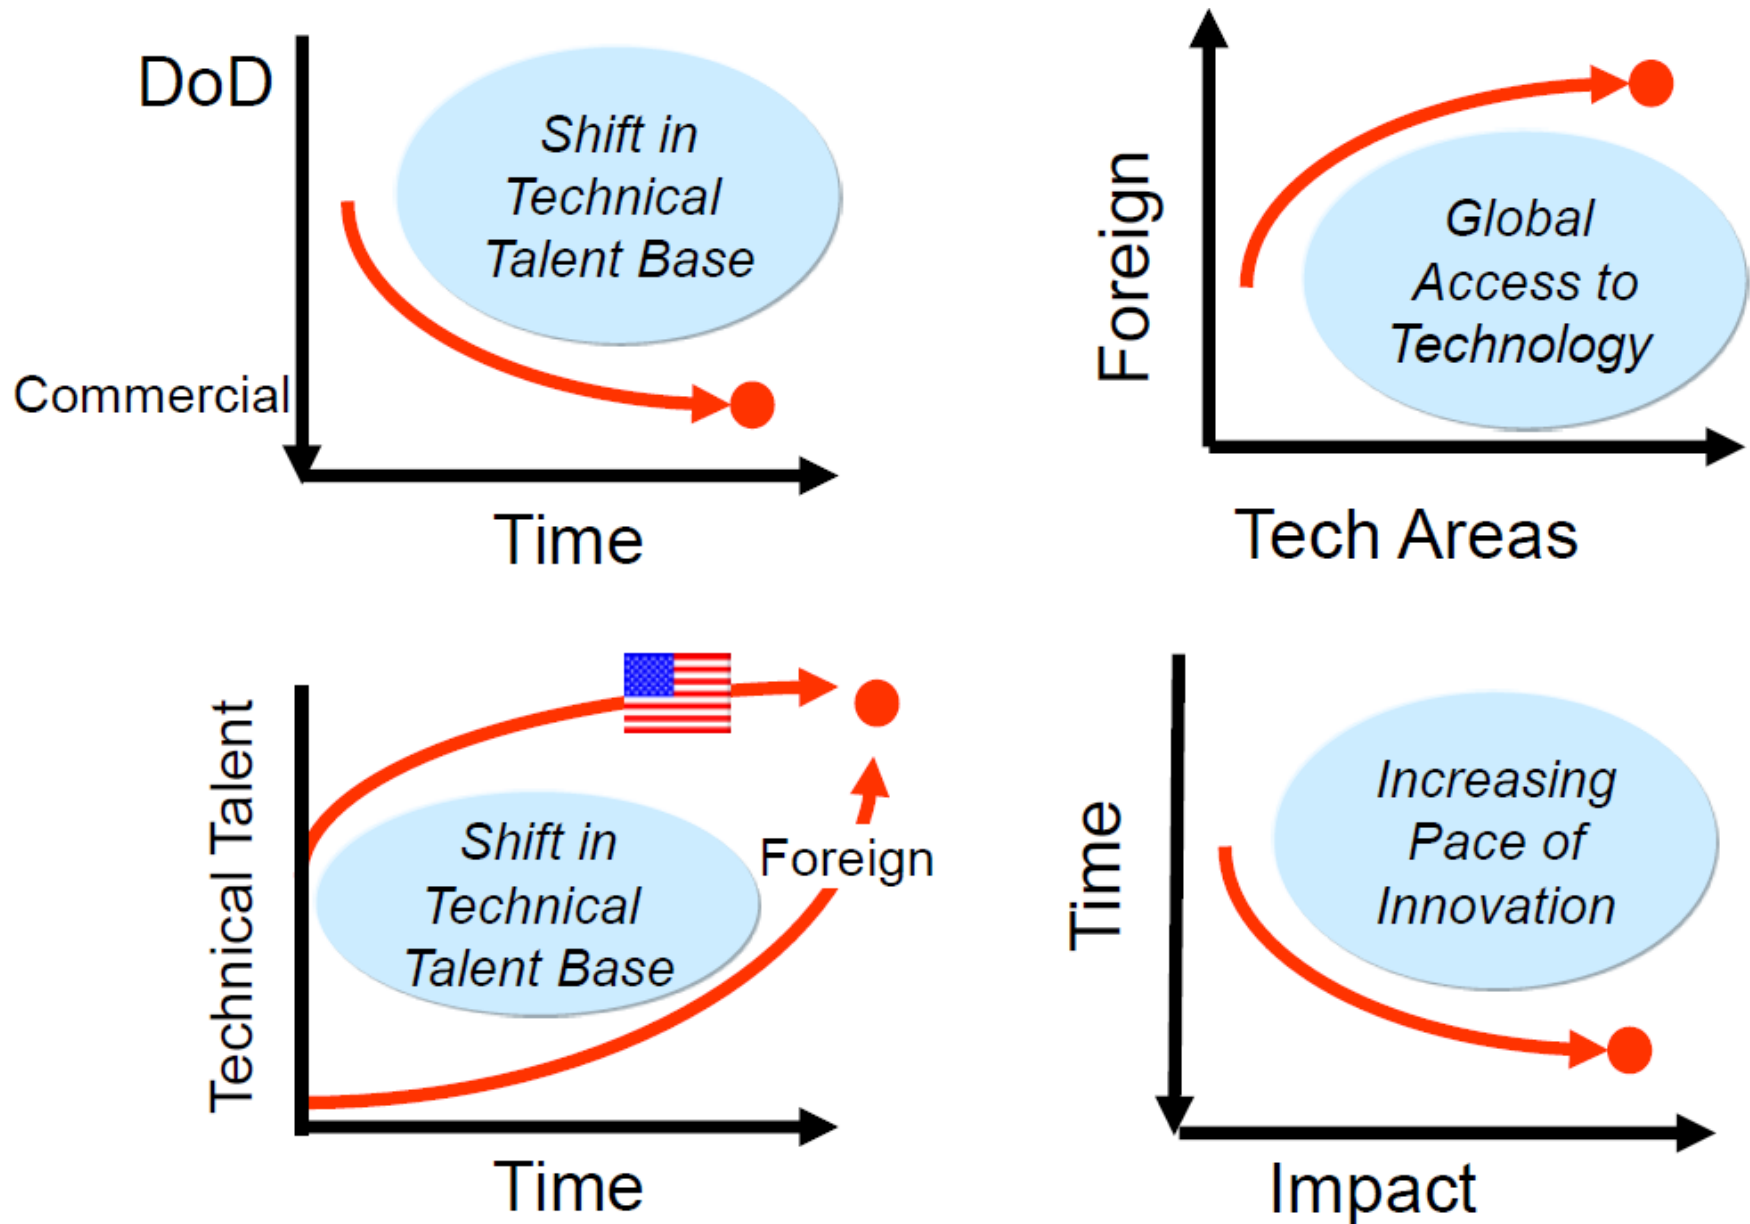

Hardware

Not all trends bode well  
for traditional business &  
technology leaders

- More emphasis on integration rather than programming
- Increased technology convergence & standardization
- Mass market economies of scale for technology & personnel
- More disruptive technologies & global competition
- Lower priced—but often lower quality—hardware & software components
- The decline of internally funded R&D (eating our seed corn)
- Potential complexity cap in next-generation systems-of-systems & ultra-large-scale systems

Ultimately, success requires mastery of  
non-commoditized domains, e.g.,  
distributed real-time & embedded systems

# Reality Check: Software Expertise in the Flat World

Conducting Leading-Edge Software R&D in a  
Globalized, Commoditized World

## **SEI's R&D Strategy**

# DoD's Software Challenge

*"New GAO report highlights \$6.9 billion in over-budget IT projects at the Department of Defense" – ZDNet, 9/30/2010*

F/A-22

SBIRS  
High

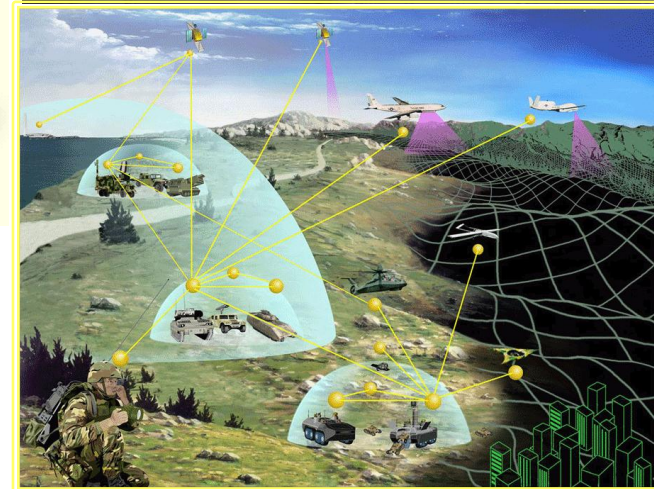

Joint Tactical Radio Systems  
(JTRS)

DDG  
1000

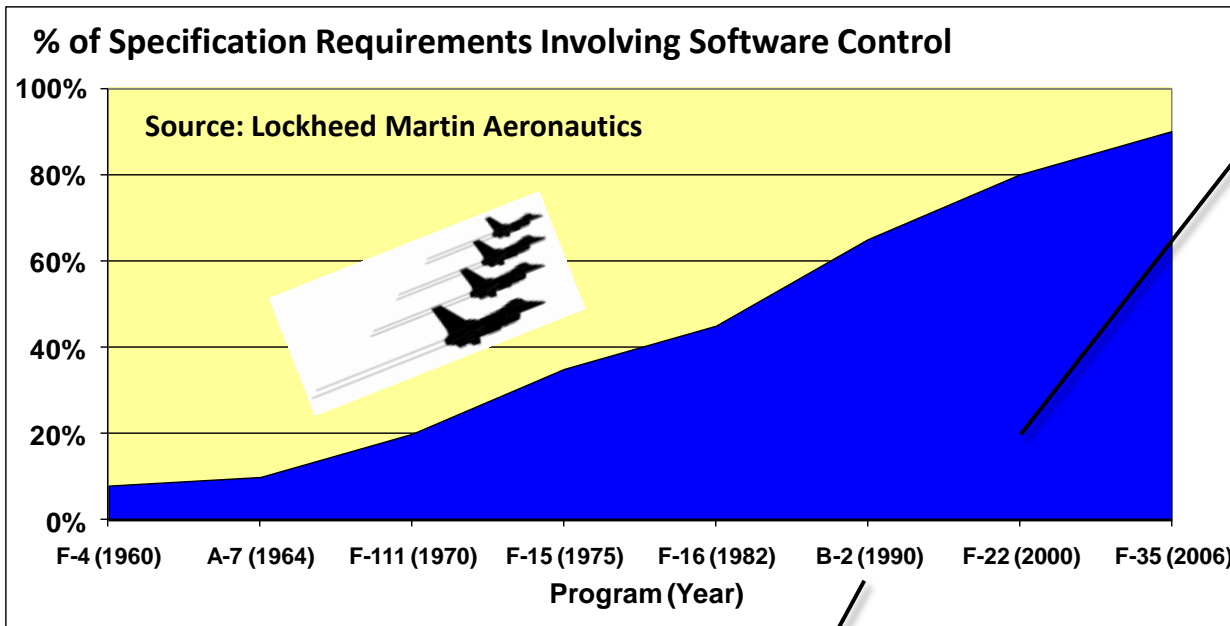

Future Combat  
System (FCS)

"If software isn't a major part of the cost of weapons systems, then it's a very significant part of the cost ... You can build a frigate which costs \$500 million to buy, but the largest part of the expense would not be the hull or the weapons, it would be the hardware and software."

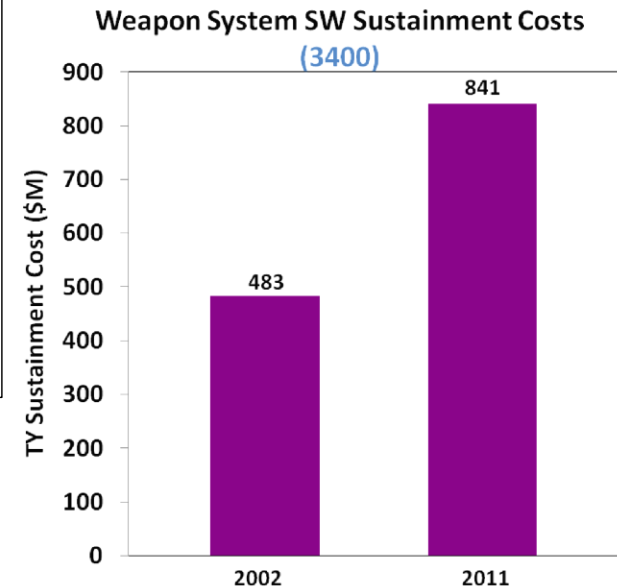

"The Software Challenge: Balancing Costs and Security Risks," January 16, 2009, Wharton Aerospace and Defense Report

# DoD Software is Growing in Size & Complexity

*Multi-year delays associated with software & system stability*

*Software & testing delays push costs above Congressional ceiling*

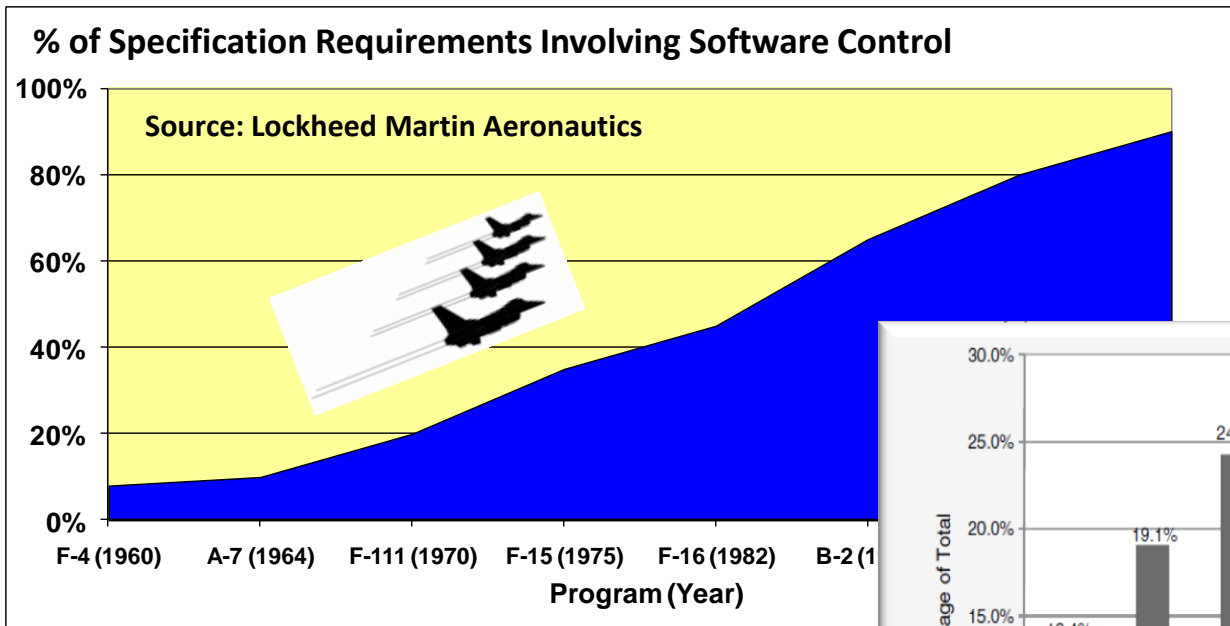

Source: FY11 Air Force SAB study on "Sustaining Aging Aircraft"

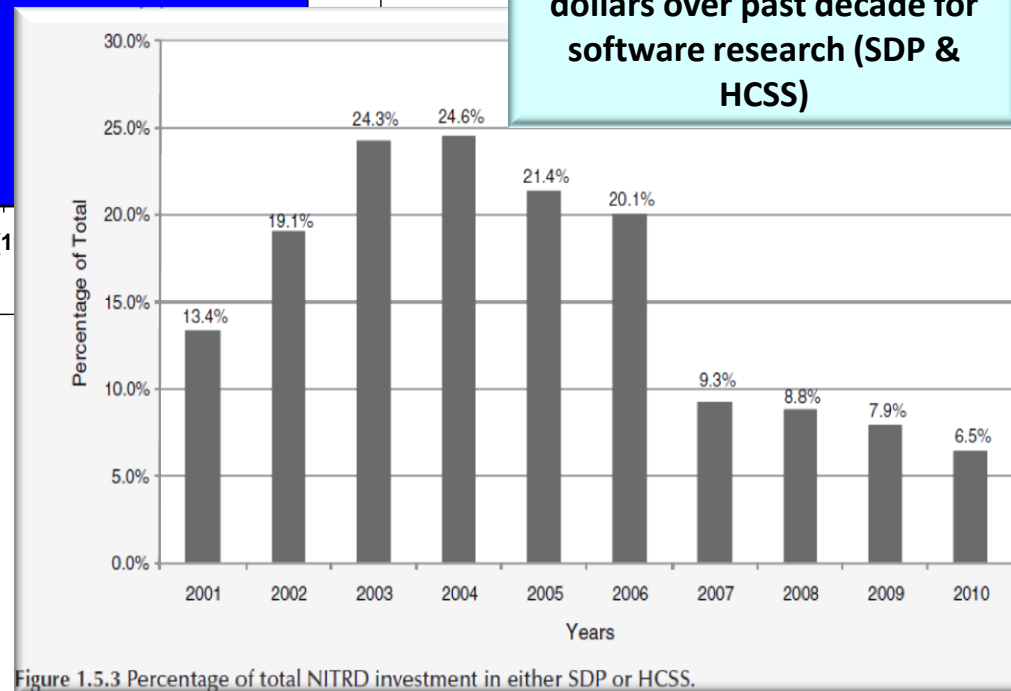

*"[Software] continues to grow in importance in our weapons systems & remains a significant contributor to program cost, schedule, & performance shortfalls."*

*— Honorable Pete Aldridge, former USD, ATL*

# DoD Software is Growing in Size & Complexity

**A 45% reduction in constant dollars over past decade for software research (SDP & HCSS)**

DoD systems are increasingly dependent upon software, but it's also increasingly hard to motivate investments in long-term software research

From NRC Report *Critical Code: Software Producibility for Defense* (2010), sponsored by Office of the Secretary of Defense (OSD)  
[www.nap.edu/openbook.php?record\\_id=12979&page=R1](http://www.nap.edu/openbook.php?record_id=12979&page=R1)

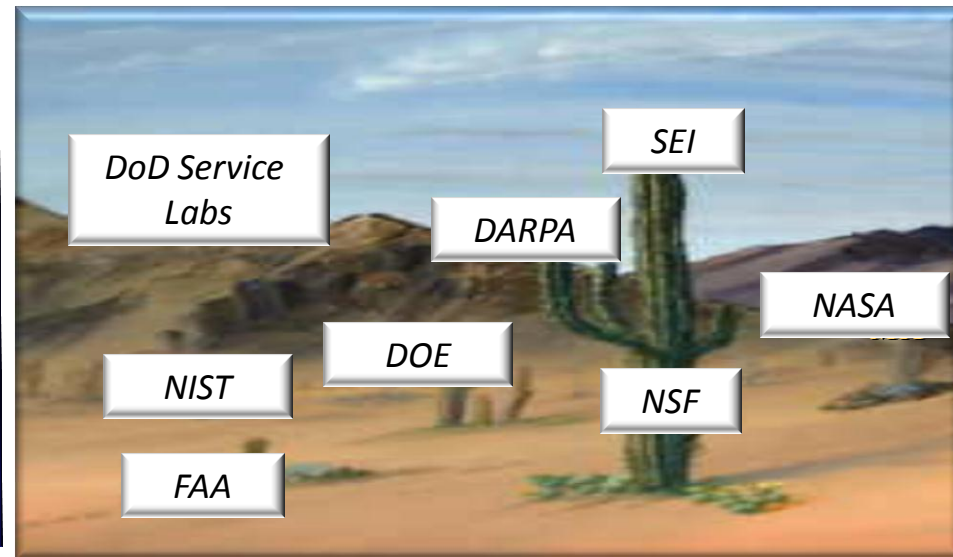

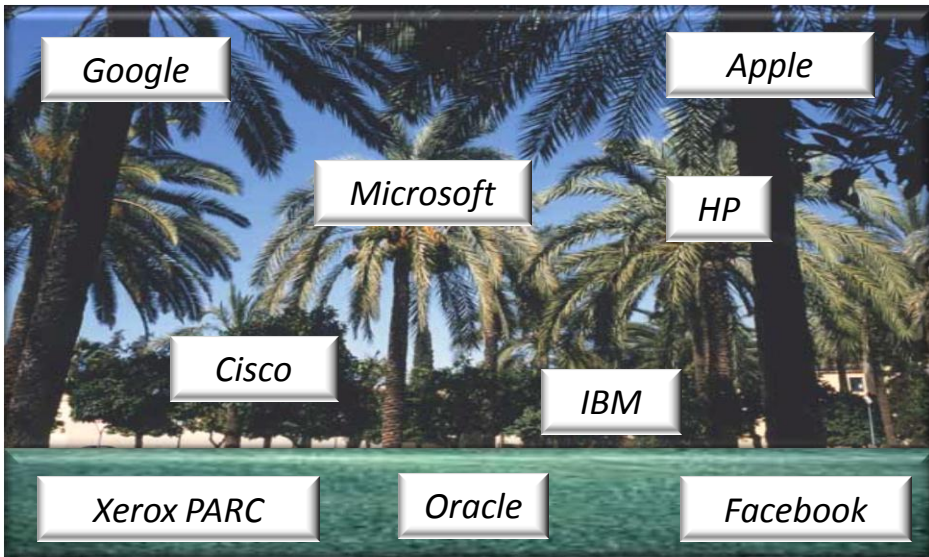

# DoD Software Science & Technology Status

## Misconception

The IT industry is a well-populated oasis for DoD programs

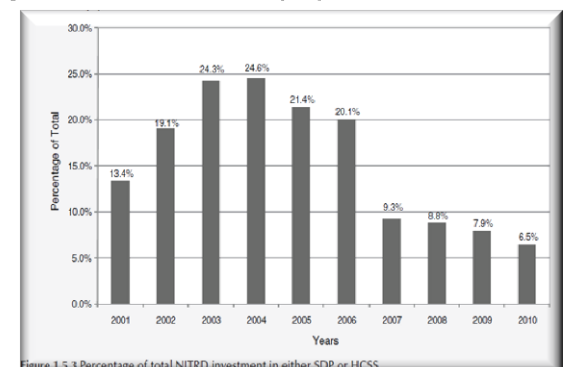

## Reality

IT R&D investment is needed to seed & transform the IT desert for the DoD

Limitations with software contribute significantly to gap between (1) the IT the DoD *needs* vs. (2) the IT the DoD can *afford* given

- Current level of technology maturity
- Decade-long tailing off of DoD software R&D investments (especially “6.2” investments)
- Atrophy of government expertise-base

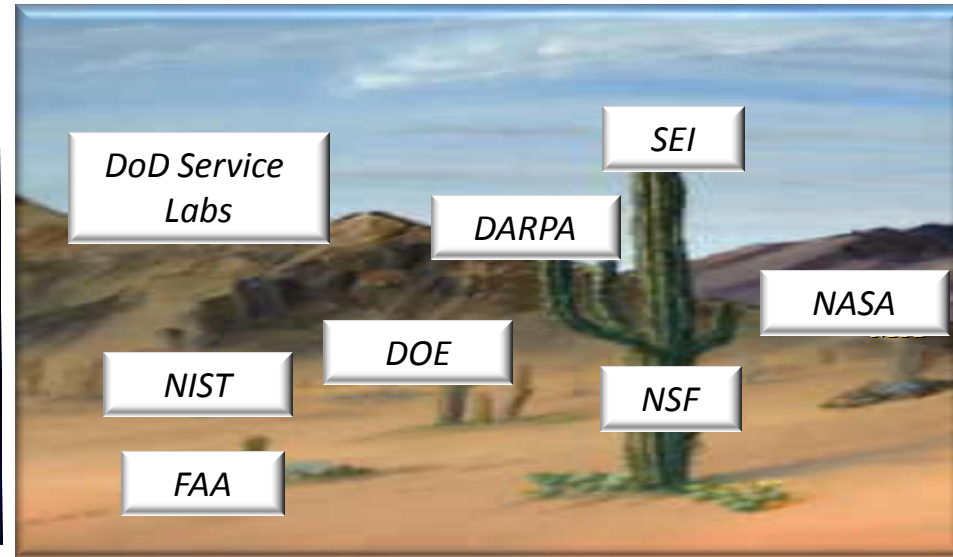

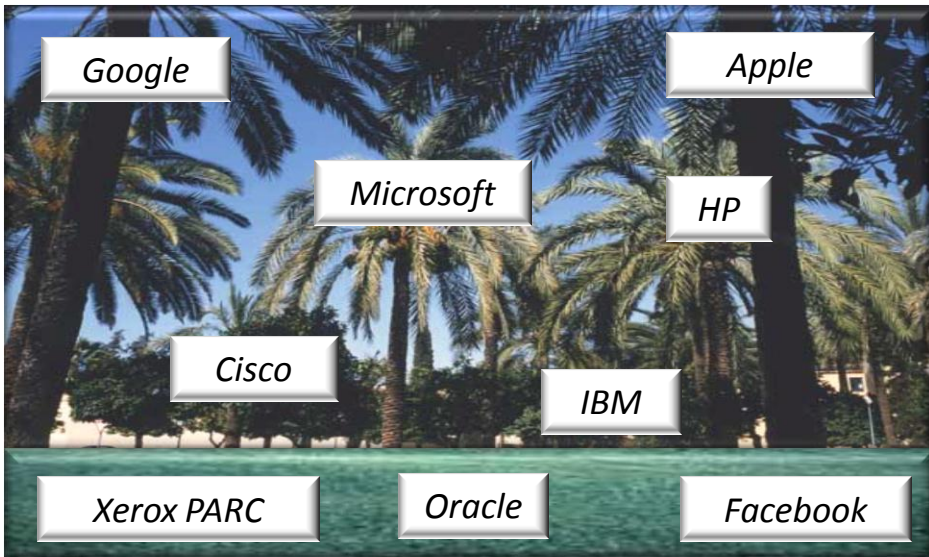

# DoD Software Science & Technology Status

## Misconception

The IT industry is a well-populated oasis for DoD programs

## Reality

IT R&D investment is needed to seed & transform the IT desert for the DoD

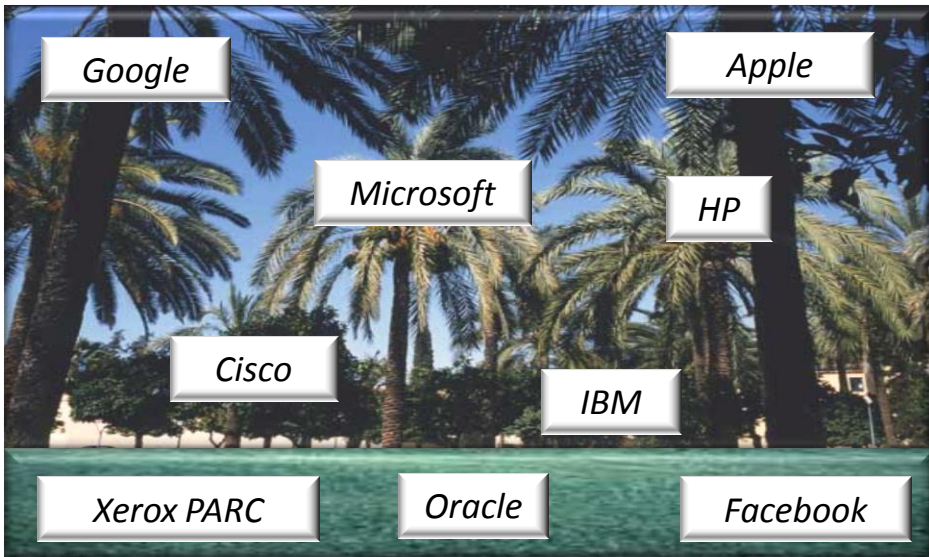

## Why Commercial Industry Alone Won't Solve the DoD Software Problem

- Commercial R&D often inappropriate for DoD problems
  - It's targeted for specific products, not long-term tech improvement
  - Focused on selling products – dependability is lower priority
  - Global resourcing/competition for R&D limits applicability to DoD

# DoD Software Science & Technology Status

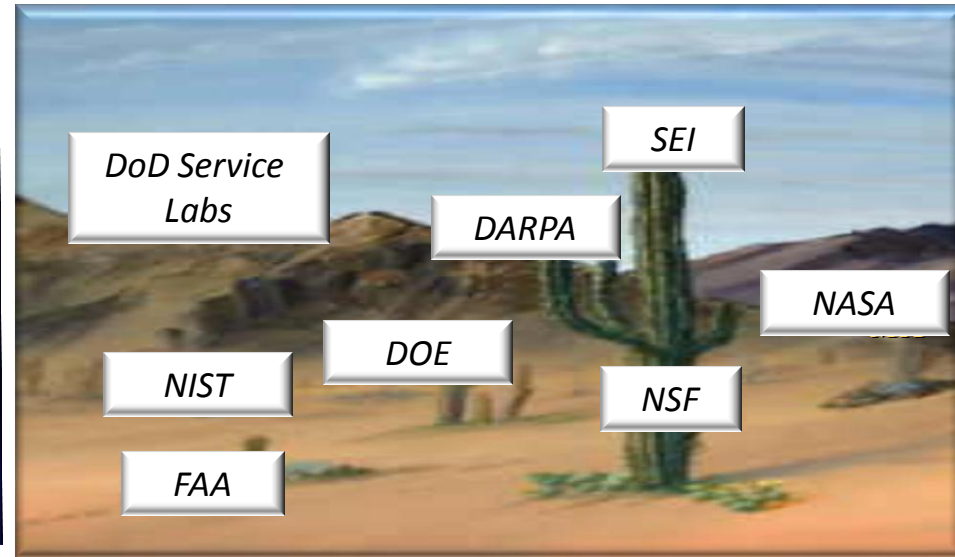

## Misconception

The IT industry is a well-populated oasis for DoD programs

## Reality

IT R&D investment is needed to seed & transform the IT desert for the DoD

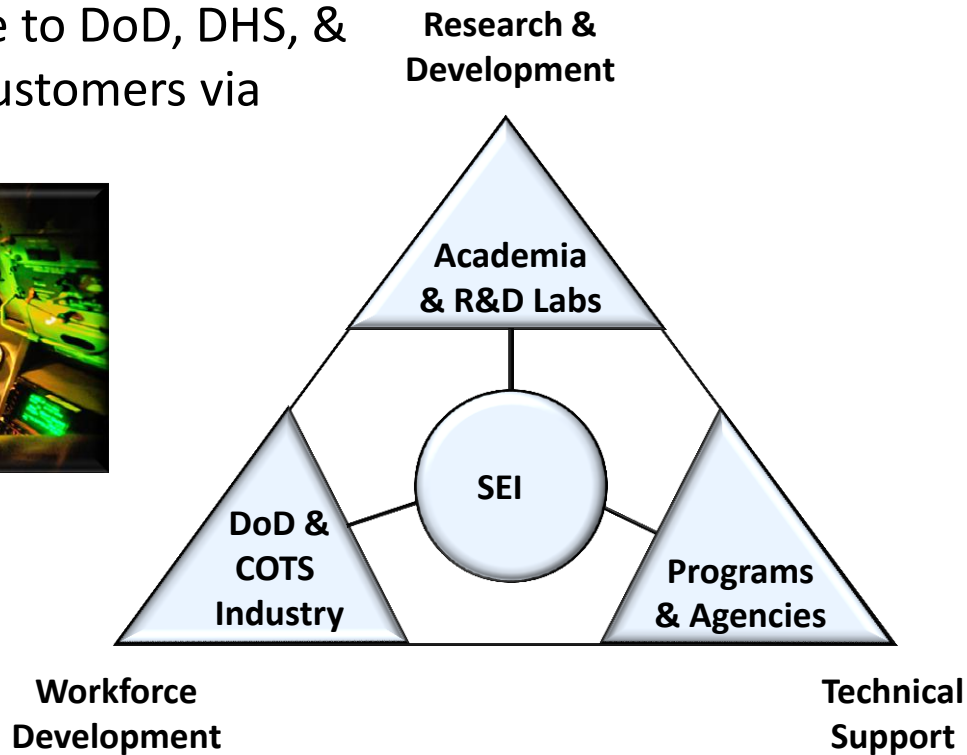

## Why Defense Industry Alone Won't Solve the DoD Software Problem

- R&D targeted at company-specific projects
- Software enhances competitiveness but not a direct profit driver for many DoD activities
- Less interest in retaining software technologies as company IP

# What the SEI Does & the Value We Provide

# What I've learned Leading/Managing R&D Groups

- Dissemination of information is essential for visibility & continued success/impact
  - Publish where it matters to ensure the most success/impact
    - e.g., where the bulk of the sponsors, customers, & partners reside
- Software R&D impact most often comes from working on hard problems together with partners, customers, & consumers
  - Be relevant, modern, practical, & scalable
- Collaborations are essential to expand R&D reach & amplify R&D expertise
- "The more you give, the more you get"
  - Open-source can be an impact accelerator

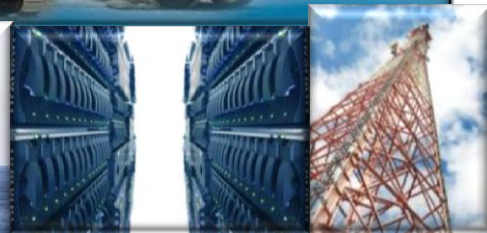

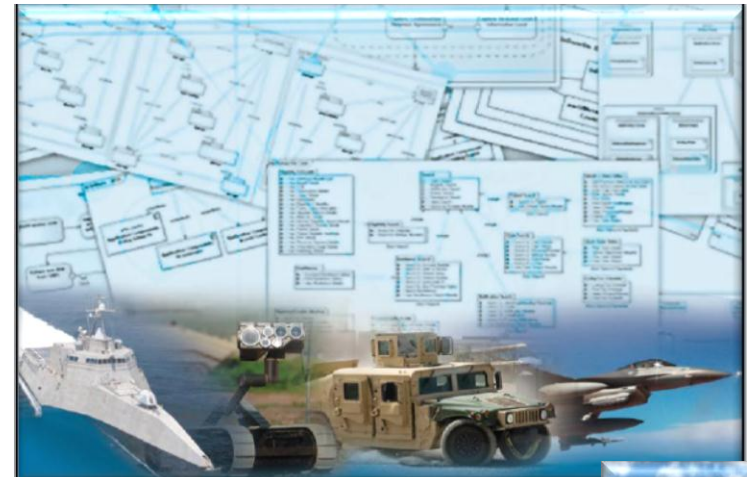

*"A person who has the knowledge, but lacks the power to express it, is no better off than if he/she never had any ideas at all." – Thucydides*

# Concluding Remarks

- In a highly commoditized, IT-driven economy, human resources are an increasingly strategic asset
  - Quality technical staff are rarely “plug compatible” or easily replaceable
- Premium value & competitive advantage accrues to individuals, organizations, & companies that
  - Continue to invest in software R&D &
  - Master principles, patterns, & protocols necessary to integrate COTS hardware & software to develop complex systems that can't be bought off-the-shelf yet
- To succeed requires close collaboration between academia, industry, & government

See [blog.sei.cmu.edu](http://blog.sei.cmu.edu) for more discussions of SEI software R&D activities

# Host Infrastructure Middleware

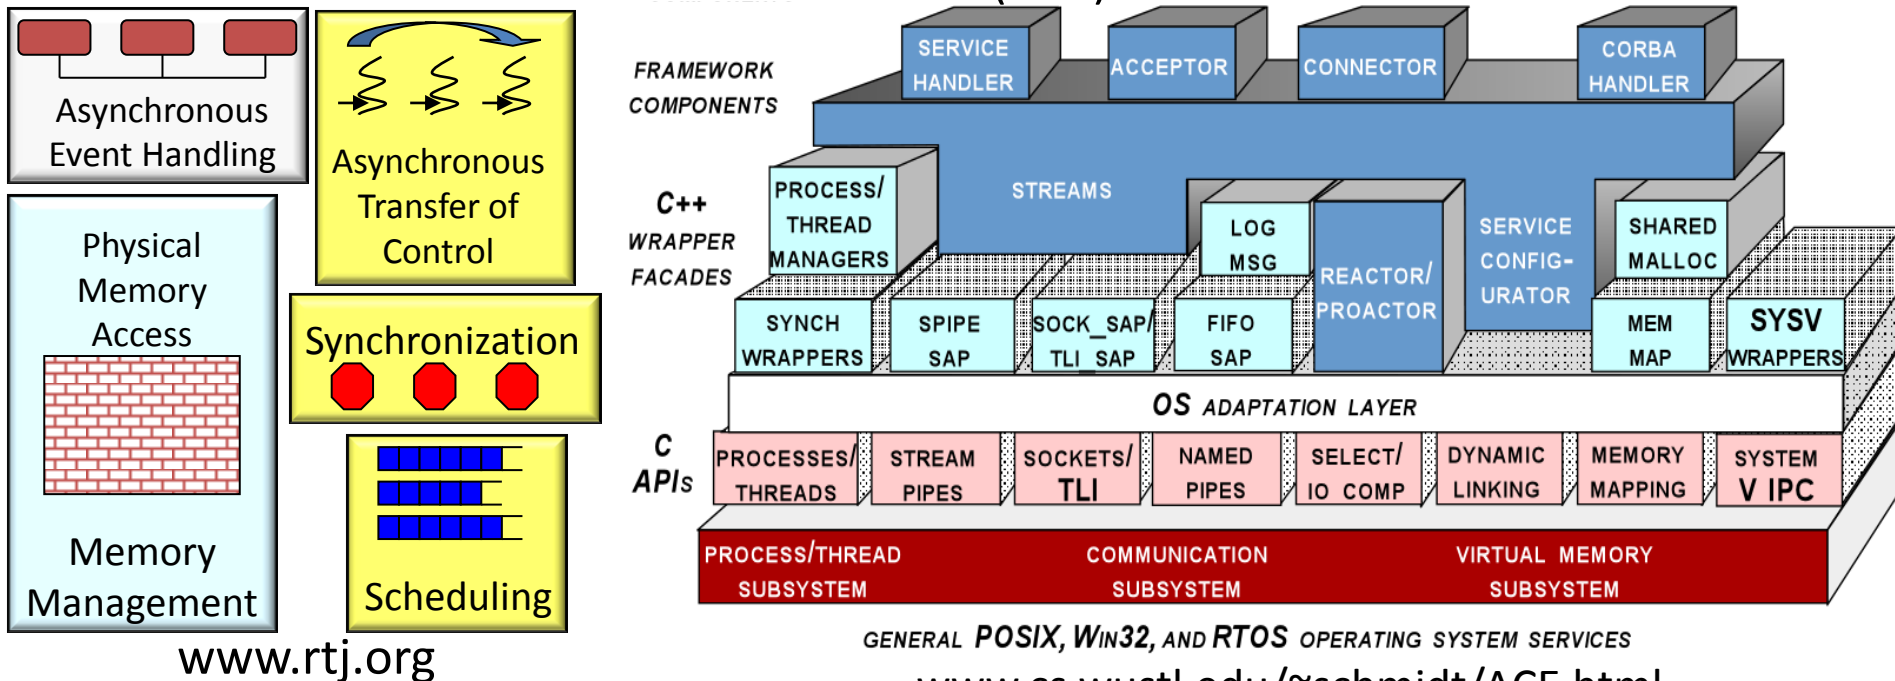

Domain-Specific Services

Common Middleware Services

Distribution Middleware

Host Infrastructure Middleware

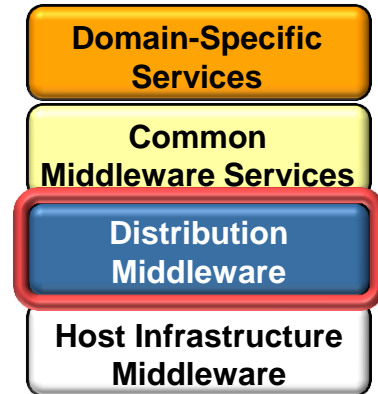

- Encapsulates & enhances native OS mechanisms to create reusable network programming components
- Examples
  - Java Virtual Machine (JVM), Common Language Runtime (CLR), ADAPTIVE Communication Environment (ACE)

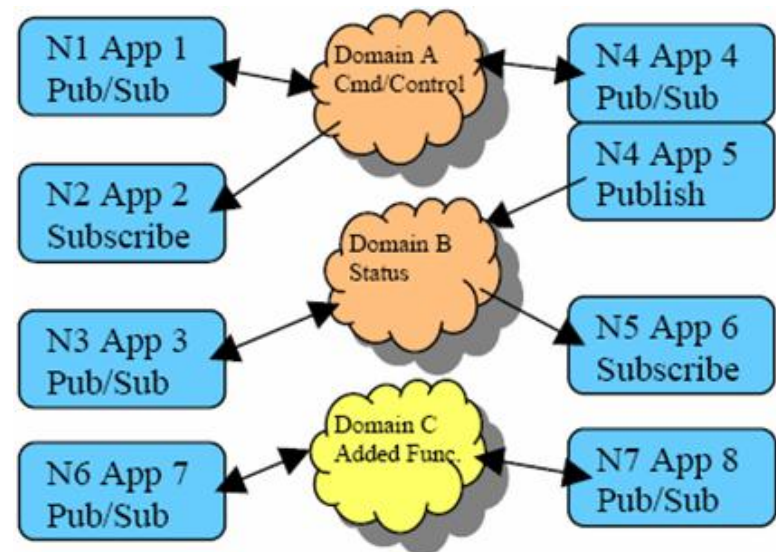

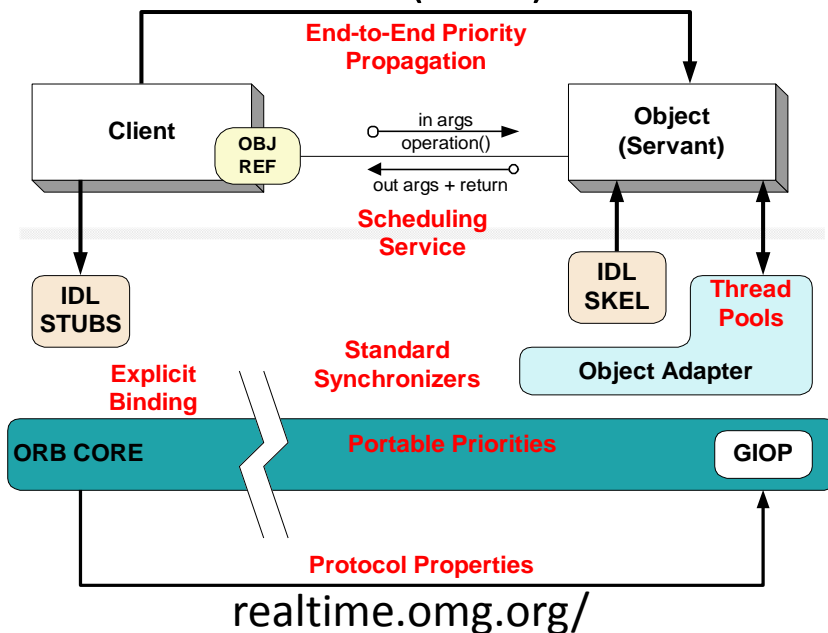

[www.cs.wustl.edu/~schmidt/ACE.html](http://www.cs.wustl.edu/~schmidt/ACE.html)

Host infrastructure middleware components abstract away many tedious & error-prone aspects of low-level OS APIs

# Distribution Middleware

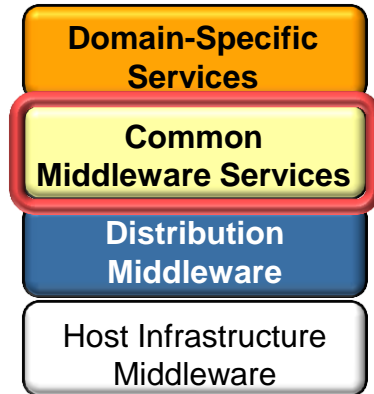

- Defines distributed programming models whose reusable APIs & components automate & extend native OS capabilities
- Examples
  - OMG Real-time CORBA & the Data Distribution Service (DDS), W3C Simple Object Application Protocol (SOAP) Remote Procedure Calls (RPCs)

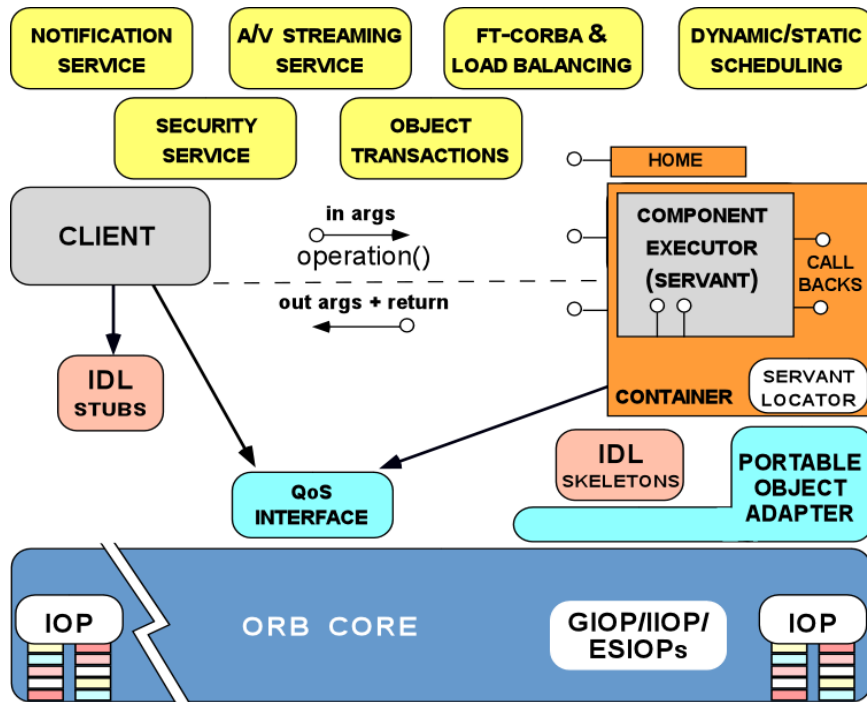

[en.wikipedia.org/wiki/Data\\_Distribution\\_Service](http://en.wikipedia.org/wiki/Data_Distribution_Service)

Distribution middleware avoids hard-coding client & server application dependencies on object location, language, OS, protocols, & hardware

# Common Middleware Services

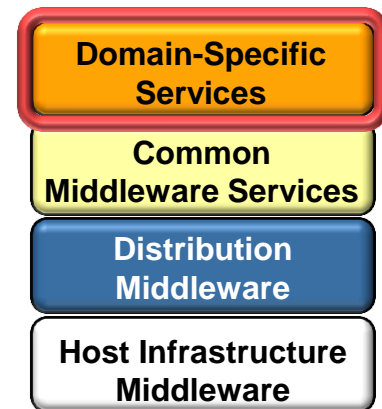

- Augments distribution middleware by defining domain-independent services that focus on programming “business logic”
- Examples
  - Sun’s J2EE, Microsoft’s .NET, W3C Web Services, CORBA Component Model & Object Services

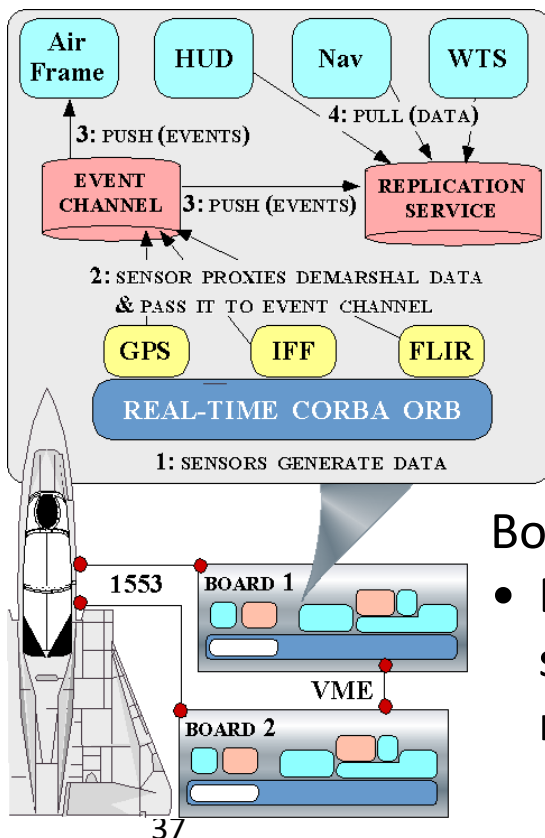

- Common middleware services support many recurring distributed system capabilities, e.g.,
  - Transactions & load balancing
  - Authentication & authorization
  - Database connection pooling & concurrency control
  - Active or passive replication
  - Dynamic resource management

# Domain-Specific Middleware

- Services tailored to the requirements of particular domains, such as telecom, e-commerce, health care, process automation, avionics, etc.
- Examples

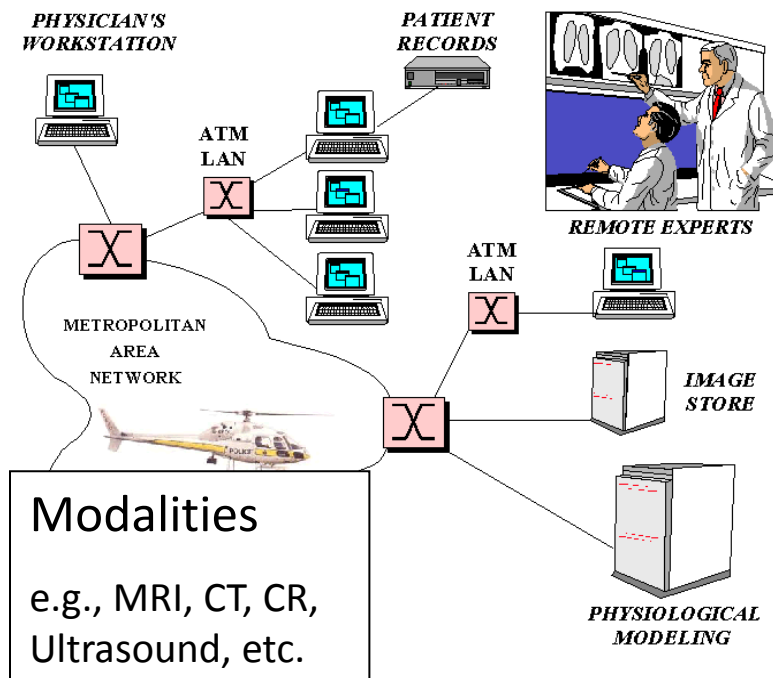

## Siemens MED Syngo

- Domain-specific services for distributed electronic medical systems
- Used by all Siemens MED business units worldwide

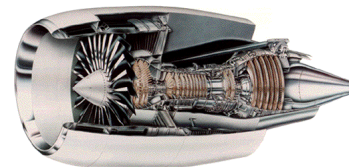

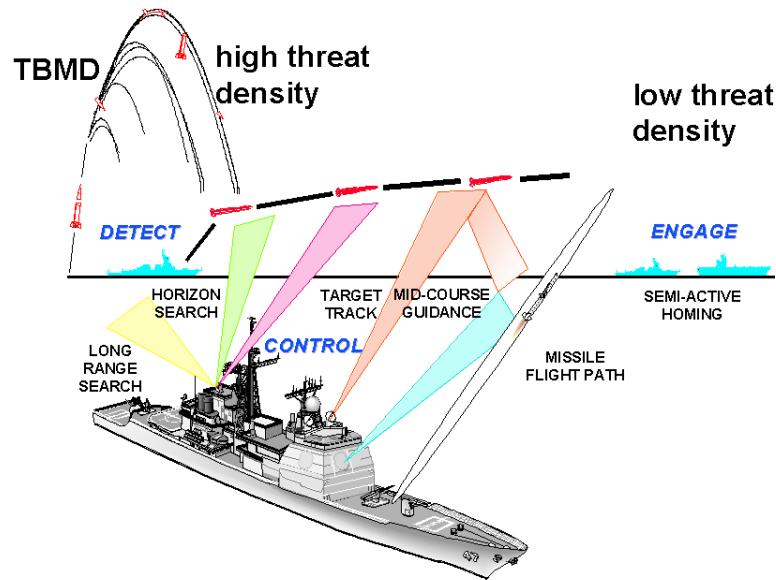

## Boeing Bold Stroke

- Domain-specific services for avionics mission computers

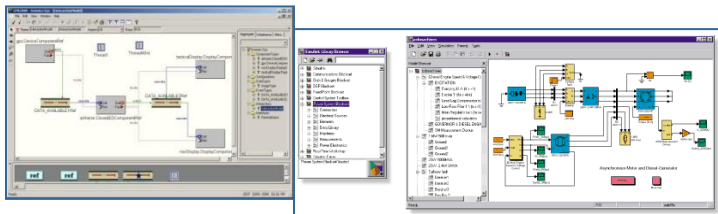

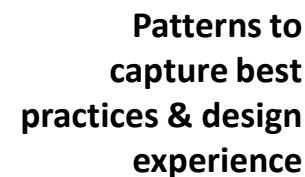

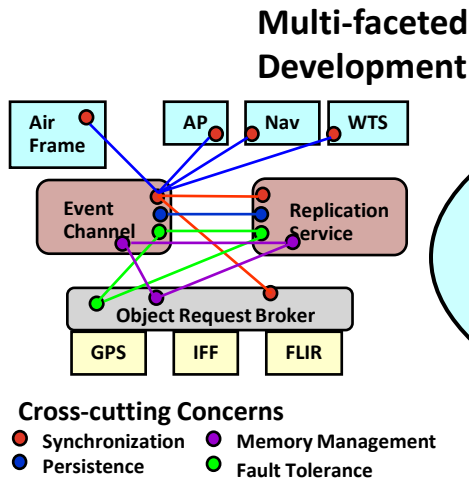

# My R&D Background: Software for Distributed Real-time & Embedded (DRE) systems

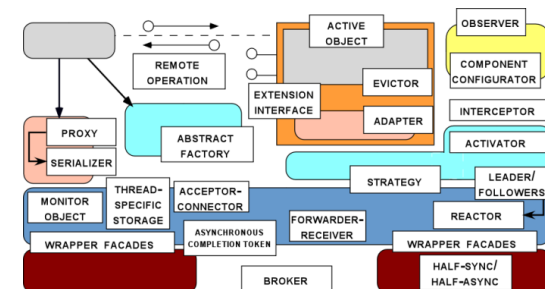

In DRE systems the “right answer” delivered too late becomes the “wrong answer”!!
